

Histogram of NGSIM Follower Speed

Selected variable: follower_speed(m/s)

Dataset: NGSIM leader-follower trajectories

This histogram shows the distribution of follower vehicle speed across all observations in the uploaded NGSIM dataset. Follower speed is a representative transportation variable because it reflects driving behavior, traffic flow conditions, and how the following vehicle responds to the leader over time.

Distribution of Follower Speed

Interpretation: The distribution centers around moderate follower speeds, with fewer observations at very low and very high speeds. This makes it a useful variable for illustrating real driving behavior and traffic conditions in the sample.
